

## A Patch for the Music Easel and Aux Card v2

Make patch connections as shown. Set knobs and switches on the Aux Card as shown. Position the switches on the 208c as highlighted. The sound source for gate 2 is the oscillator out of the Aux Card.

This patch integrates the 218e such that its pitch controls the AuxCard pitch and the velocity multiplies with the 208C envelope, which then controls both gates. The 218e strip cross fades between the AuxCard waveshape and noise, while pressure filters that noise. Random is triggered by strip touches. One random CV is patched to control modulation oscillator range while the other controls the modulation type and the mode of the gates.
